

The Key to Increased Production

One May day in 2015, the respected Comrade Kim Jong Un visited a fish farm in a remote mountainous area, busy as he was dealing with state affairs.

In the general control room, he carefully saw that water temperature and oxygen amount of fish ponds were measured and controlled on a real-time basis and the conditions of fishes were monitored by means of underwater camera.

Noting that production can be normalized on a high level when fish farming is put on a scientific and modern basis, he spoke highly of the farm as it has established a management system as intended by the Party.

After a while, he stressed the need for the fish farm to make the most of its existing capacity to produce tasty fishes with hygienic safety in larger quantities with feed of highly nutritive value, as well as to build up its sci-tech forces and intensify technical studies among its employees.
